

### Rotary Hook

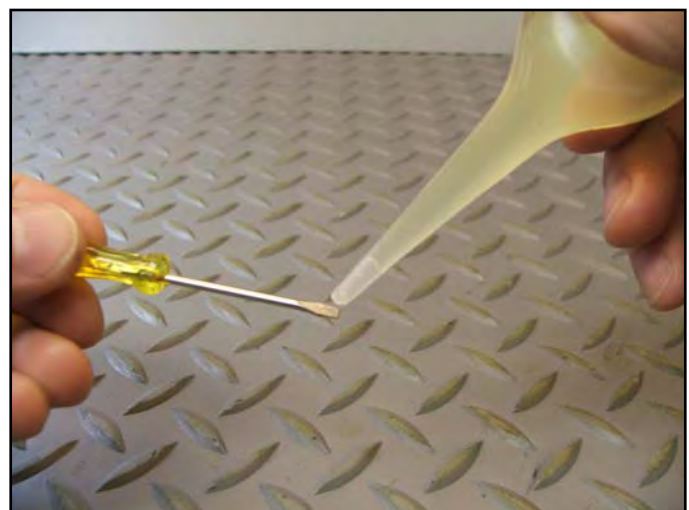

- Use a brush and / or compressed air to clean the hook and surrounding area.

- Use a brush and / or compressed air to clean the bobbin thread sensor (if equipped).

- Rotary hooks are lubricated with rotary hook oil (Mobil® Velocite #10), #001322.50.00
- Note: The use of other (particularly heavier) oils will definitely cause poor stitch quality.
- Oil the hook by first applying 1 full drop of oil to the tip of a small screw driver...

- Then touch the tip of the screw driver to the hook where the silver basket and black gib meet. Sufficient oil will wick from the screw driver to the hook.
- This method of oiling the hook prevents you from applying excess oil which will later get on the thread.
